Presentation Outline

Insurance Scoring & Personal Lines Insurance

- **What is "Insurance Scoring?"**

- **Why Do Insurers Use Credit Info?**

- **Information Used by Insurers**

- **The Science Behind Scoring**

- **Actual Example of Consumer Savings**

- **Review of the Evidence**

- **Relationship Between Credit & Income**

- **Search for Adverse Impact**

Insurance Scoring

- What is "Insurance Scoring"?
  - ➢Insurance scores are <u>HIGHLY</u> accurate predictors of future loss in auto and homeowners insurance
  - ➢Insurance scores provide an objective, accurate and consistent tool that insurers use with ***other*** applicant information to better anticipate claims
  - ➢Insurers use credit information as a way of determining individual's responsibility and performance under the terms of an insurance contract, allowing insurer to offer a price that is more fair and equitable

Why Do Insurers Use Credit Information?
Why Insurers Use Credit Information in Insurance Underwriting

1. There is a ***strong correlation*** between ***credit standing*** and ***loss ratios*** in both auto and homeowners insurance.

2. There is a ***distinct*** and ***consistent decline*** in relative ***loss ratios*** (which are a function of both claim frequency and cost) as ***credit*** standing ***improves***.

3. The relationship between credit standing and relative loss ratios is statistically ***irrefutable***.

4. The odds that such a relationship does not exist in a given random sample of policyholders are usually between 500, 1,000 or even 10,000 to one.

What You Might Not Know About Insurance Scoring

1. Insurers have been using credit since early 1990s
   - ➢ Credit has been used in commercial insurance for <u>decades</u>
2. Insurance scores do ***<u>not</u>*** use the following information:
   - ➢ *Ethnicity   Nationality   Religion   Age*
   - ➢ *Gender   Marital Status   Familial Status   Income*
   - ➢ *Address   Handicap*
3. Insurance scoring is revenue neutral
4. Increased use of credit information is a fact of life in the 21st century (*Why?*: Works for trust-based relationships)
   - ➢ *Loans   Leases   Rentals   Insurance*
   - ➢ *Utilities   Background Checks   Empl. Screening*

*Intuition Behind Insurance Scoring**

1. **Personal Responsibility**
   - ➢ Responsibility is a personality trait that carries over into many aspects of a person's life
   - ➢ It is intuitive and reasonable to believe that the responsibility required to prudently manage one's finances is associated with other types of responsible and prudent behaviors, for example:
     - Proper maintenance of homes and automobiles
     - Safe operation of cars

2. **Stability**
   - ➢ It is intuitive and reasonable to believe that financially stable individuals are likely to exhibit stability in many other aspects of their lives.

3. **Stress/Distraction**
   - ➢ Financial stress could lead to stress, distractions or other behaviors that produce more losses (e.g., deferral of car/home maintenance).

*This list is neither exhaustive nor is it intended to characterize the behavior of any specific individual.

Source: Insurance Information Institute

Consequences of Banning Use of Credit in Insurance Underwriting

Banning the use of credit information will:

- Force good drivers and responsible homeowners to subsidize those with poor loss histories by hundreds of millions of dollars each year.

- Decrease incentives to drive safely

- Decrease incentives to properly maintain cars and homes

- Force insurers to rely on less accurate types of information, such as DMV records.

- Make non-standard risks more difficult to place

- Increase size of residual market pools/plans

Risk & Loss

Accounting for Differences in Losses by Risk Characteristics Makes Insurance Pricing More Equitable
# Gender of Drivers Involved in Fatal Auto Accidents, 2000

Interpretation:

Males are 69% more likely to be driving in fatal auto accidents. Should this be ignored and females be forced to subsidize males?

OF COURSE NOT!

No. Drivers in Fatal Accidents/billion miles driver

Male	27
Female	16

Source: National Safety Council
Age of Drivers Involved in Auto Accidents, 2000

Bar chart — Involvement Rate per 100,000 Licensed Drivers:

Age	Rate
16-20	61.88
21-24	45.96
25-34	31.65
35-44	26.19
45-54	22.59
55-64	20.81
65-69	18.3
Overall	29.95

Interpretation:

Drivers age 16-20 are 2 to 3 times more likely to be involved in auto accidents. Should this be ignored with better, more experienced drivers subsidizing teenagers?

OF COURSE NOT!

Source: National Highway Traffic Safety Administration, *Traffic Safety Facts 2000.*

11

Credit Quality & Auto Insurance*

Interpretation

Individuals with the lowest scores have losses that are 32.4% above average; those with the best scores have losses that are 33.3% below average.

Should those who impose less cost on the system be forced to subsidize those who impose more?

| Score Range	Relative Performance
>591	1.324
592-624	1.122
625-646	1.107
647-665	1.070
666-681	0.978
682-697	0.922
698-713	0.969
714-731	0.859
732-754	0.798
755+	0.767

Score Range

12

Actual Example:

## How Insurer Use of Credit Benefits Consumers & What Consumers Stand to Lose
Example: Insurance Savings from Use of Credit Information

- Insured lives in Westchester County, NY (NYC suburb)
- 2 fully insured vehicles ($250K/$500K liability, $1000 deductible)
  - 2000 Nissan Xterra & 1994 Honda Civic
- Insured's biannual premium was $862 (March 2003 renewal)
  - No accidents or moving violations on record
- Insured's credit-related discount for the 6-month period was $148 out of $410 in total discounts.
  - Credit-related discount saves consumer nearly $300/year
  - Effectively lowers premium by 14.7%
  - Should this (and millions of other) consumers be denied this discount? Some regulators and consumer groups want you to pay more unnecessarily and subsidize bad drivers.
- August 2002 FICO Score = 777 (out of 850) (= 72nd percentile)
  - i.e., 28% have better (higher) scores, 72% have lower (worse) scores

14

Example (cont'd): Credit Discount Can Save $100s per Year*

- Credit discount lowered annual premium by 14.7%
- Policyholder saved nearly $300
- Credit was single largest discount
- Opponents of credit will force people to pay more for coverage

Total Annual Savings from Discounts: $820

Safety/Anti-Theft Discount 19% — $154

Credit-Related Discount 36% — $296

Multipolicy Discount 21% — $174

Good Driver Discount 24% — $196

*Annualized savings based on semi-annual data from example

Review of the Evidence:

History, Studies,
Data & Analyses

Casualty Actuarial Society Credit Study

Personal Automobile Loss Ratio by Credit Category				
Category	Earned Premium	Incurred Loss	Loss Ratio	Loss Ratio Relativity
A	$74,279	$75,333	101.4%	133
B	158,922	124,723	78.5%	103
C	69,043	47,681	69.1%	91
D	91,746	52,688	57.4%	75
Total	**$393,990**	**$300,425**	**76.3%**	

Category A – Unacceptable Credit Rating
Category B – No established credit history (or does not meet the definition of A, C or D)
Category C – Good Credit Rating
Category D – Excellent Credit Rating

# Major Auto Company Analysis of Credit and Loss Ratio*

Interpretation:

Those with poorest credit scores generated losses more than double that of those with the best scores
*Average loss ratios for new auto policies written over a 3-year period.

Texas Auto: Relative Loss Ratio
(by Credit Score Decile, Total Market)*

Interpretation:

Those with poorest credit scores generated losses more than double that of those with the best scores

Y-axis: **Avg. Relative Loss Ratio**

Bar values:
- No Score: 1.07
- 1st: 1.53
- 2nd: 1.35
- 3rd: 1.14
- 4th: 0.99
- 5th: 0.94
- 6th: 0.99
- 7th: 0.83
- 8th: 0.81
- 9th: 0.74
- 10th: 0.75

Extremely strong statistical evidence linking credit score with loss/claim outcomes:
- Credit score & likelihood of positive claim (p<.0001)
- Size of loss related to credit score (p<.0001)
- Correlation between relative loss ratio and credit score (r = .95)

Score Range

1st Decile = Lowest Credit Scores
10th Decile = Highest Credit Scores.

*Each decile contains approximately 15,300 policies. Includes standard and non-standard policyholders.

Tillinghast Towers-Perrin Study

- Studied 9 Samples of Data from 8 Companies*
  - ➢ Looked at loss ratio relativity in relation to insurance score
  - ➢ Studied both auto/home
- Analyzed probability that a correlation exists between insurance score and loss ratio relativity
  - ➢ In 8 of 9 samples, probability that a statistically significant correlation exists exceeded 99% (in one case the probability was approximately 92%)
*One company supplied both auto and homeowners data. The submissions are counted as separate companies for the purposes of this analysis.

EPIC Study *(June 2003 NAIC Meeting)*

- Analyzed random sample of claim records totaling 2.7 million earned car years from all 50 states for period from 7/1/00 through 6/30/01

4 MAJOR FINDINGS:

1. Insurance scores were found to be *correlated* with the propensity of loss (primarily due to frequency)

2. Insurance scores *significantly* increase accuracy of the risk assessment process, even after fully accounting for interrelationships with other variables.

3. Insurance scores are among the 3 *most important* risk factors for each of the 6 coverage types studied

4. Study results apply generally to *all* states and regions

Indicated Relative Pure Premium by Insurance Score (PD Liability)*

Interpretation:

Those with poorest credit scores had loss experience 33% above average while those with the best scores had loss experience that was 19% below average

Washington State Study on Credit Scoring in Auto UW & Pricing

STUDY DESIGN

- WA State study released in January 2003 required under ESHB 2544, which also restricted the use of scoring

- Conducted by Washington State University (WSU)

- Objective was to determine who benefits/is "harmed" by scoring, impact of scoring on rates, disparate impacts on "the poor" or "people of color"

- Sampled about 1,000 auto policyholders from each of 3 insurers: age, gender, zip, inception date, score/rate class.

- Study's models typically explain only 5% - 15% of variation (very low R-square in regression analyses)

- WSU contacted policyholders asked: ethnicity, marital status, income, details of experience if cancelled

Washington State Study on Credit Scoring in Auto UW & Pricing

SUMMARY OF FINDINGS

- Statistically the findings are extremely weak, leading even the study's author to conclude: *"The ...models only explain a fraction of the variance in score or discount found in the sample population"* and that *"...while there are statistically detectable patterns in the demographics of credit scoring, most of the variation among individual scores is to due to random chance or other facts not in this data."*

- Study's models typically explain only 5% - 15% of variation (very low R-square in regression analyses).

- Strongest and most consistent finding is that credit score is positively associated with ***age***

  ➢ Implication: banning on scoring creates disparate impact on older, more experienced drivers

33

Problems With Such Studies

- Already statistically irrefutable evidence that scoring works. This fact is ignored in WA study.
- Ignores fact that scoring is 100% blind to ethnicity, color, gender, marital status, income, location, etc.
- Introduces the divisive issue of race into an issue where it does not belong (and doesn't exist today)
- *Perpetuates false stereotype that minorities and the poor are incapable of managing their finances responsibly*
- Puts regulators in awkward position of determining who is a minority, who is poor
- Lead to disparate impacts on groups such as older drivers, people who file few claims, and millions of minorities and low income people who benefit today
- Leads to poor public policy decisions that produce perverse economic incentives (e.g., subsidies to drivers who have higher relative losses)

34

The Relationship Between Income and Credit Score
Wealthy Americans Have the Highest Debt as a % of Disposable Income
Debt-to-Income Ratios

It is a myth that only lower-income people have problems managing their debt

Homeownership Rates in New York State, 1990 to 2002

Homeownership is at a record high in New York State and has grown at a faster pace than the US overall. Virtually all of insurance policies sold on these homes were scored. Some of the greatest in-roads have been made among people of modest income and minority groups. *There is absolutely no evidence whatsoever to support disparate impact.*
