2008 Natural Catastrophe Review

Thursday, January 15, 2009

Munich Re
Insurance Information Institute
Introduction
Bob Kinsella, Spokesperson, Munich Re Group

U.S. Catastrophe Update
Carl Hedde, Head of Risk Accumulation, Munich Re America

Global Catastrophe Update
Ernst Rauch, Head of Corporate Climate Center, Munich Re

Economic Implications
Dr. Robert Hartwig, President, Insurance Information Institute

Q+As
Carl Hedde  
**Head of Risk Accumulation**  
**Munich Re America**

Responsibilities include oversight of corporate accumulation issues at Munich Re America; including the use of catastrophe risk models, client cat risk consulting services, and portfolio management and optimization. Additionally, he manages a group of scientists that provide seismological and meteorological expertise and research capabilities to Munich Re America and its’ clients.

Mr. Hedde received a Bachelor of Science Degree from the State University of New York – Albany, and holds the CPCU Designation. He has 25 years experience at Munich Re America, holding various positions within the company.
Ernst Rauch joined the staff of Munich Re's Geo Risks Research Department in 1988. His work initially focussed on earthquake risk analysis and the development of an earthquake simulation model. Since the early 1990s his area of responsibility shifted increasingly to the analysis and modelling of meteorological risks. After becoming section leader in 2000, he was appointed head of the Meteorological and Climate Risks Department at Munich Re in April 2004.

In 2007 Ernst Rauch took on the responsibility of coordinating all climate change-related activities in the Munich Re Group together with the function of department head of natural catastrophes research and development projects. Since April 2008 Ernst Rauch heads the recently-founded Munich Re Corporate Climate Center.

Ernst Rauch has a degree in General and Applied Geophysics from the University of Munich. He is a member of the German Geophysical Society, the Wind Engineering Society (WTG, Germany), the Australian Earthquake Engineering Society, and the American Association for Wind Engineering.
Speakers (3)

Robert P. Hartwig
President
Insurance Information Institute

Since joining the I.I.I. in 1998 as an economist and becoming chief economist in 2000, Dr. Hartwig has focused his work on improving understanding of key insurance issues across all industry stakeholders including media, consumers, insurers, producers, regulators, legislators and investors. Dr. Hartwig previously served as director of economic research and senior economist with the National Council on Compensation Insurance (NCCI) in Boca Raton, Florida. He has also worked as senior economist for the Swiss Reinsurance Group in New York and as senior statistician for the United States Consumer Product Safety Commission in Washington, D.C. He is a member of the American Economic Association, the American Risk and Insurance Association, the National Association of Business Economics and the CPCU Society and serves on the board of directors of the Independent Insurance Agents and Brokers Association of New York. In 2005 and 2006 Dr. Hartwig served on the state of Florida’s Task Force for Long-Term Homeowners Insurance Solutions.

Dr. Hartwig received his Ph.D. and Master of Science degrees in economics from the University of Illinois at Urbana-Champaign. He also received a Bachelor of Arts degree in economics cum laude from the University of Massachusetts at Amherst. He has served as an instructor at the University of Illinois and at Florida Atlantic University. Dr. Hartwig also holds the Chartered Property Casualty Underwriter (CPCU) credential.

Dr. Hartwig has authored and co-authored papers that have appeared in numerous publications, including the Journal of Health Economics, the Proceedings of the Casualty Actuarial Society, the John Liner Review (where he also serves on the editorial board), Dossiers et Etudes (Geneva Association), the Journal of Workers’ Compensation, Global Reinsurance, Risk & Insurance, Insurance Day, Compensation and Benefits Review. He is also a regular contributor to National Underwriter and many other industry trade publications.
U.S. Natural Catastrophe Update

MR NatCatSERVICE
One of the world’s largest databases on natural catastrophes

The database today:

- From 1980 until today all loss events; for the U.S. and selected countries in Europe all loss events since 1970
- Retrospectively all great disasters since 1950
- In addition, all major historical events starting from 79 AD – eruption of Mt. Vesuvio (3,000 historical data sets)

Currently more than 25,000 events
Insured losses in the United States in 2008 were above $30 billion - one of the top five annual totals in U.S. history

Six tropical cyclones made landfall in the U.S., three at hurricane intensity: Dolly, Gustav, and Ike

Record insured losses due to thunderstorms

Damaging wildfires in Southern California

Winter storm insured losses below average

June floods in the Midwest break historical river level records

Hurricane Ike 2008

- U.S. insured losses currently estimated at $15 billion
- In terms of insured losses, 3rd most costly hurricane (in original values) after Katrina’05 and Andrew ’92
- At least 82 victims and more than 200 people missing in the US
- Galveston, Texas with sustained winds of 110 mph (Cat. 2)
- Ike had a similar track to the 1900 Galveston hurricane (Category 4), which destroyed the city and killed more than 6000 people
- Strongest storm on record in terms of Integrated Kinetic Energy
Hurricane Ike 2008: Unique Aspects

- **Extremely large wind field**
  
  Diameter of hurricane and tropical force winds were 240 miles and 550 miles, respectively. The corresponding values for Katrina’05 were 175 and 440 miles.

- **Extreme storm surge**
  
  Due to its large size and slow movement, Ike produced a storm surge corresponding to a Cat 4 hurricane affecting a 300 miles wide area of the Gulf coast from Louisiana to Texas. In addition, large swell and extreme waves were generated in the Gulf of Mexico.

- **Storms and Flooding in the Midwest**
  
  After landfall, Ike merged into an existing cold front, which strengthened due to Ike’s warm and moist air. The resulting system caused storms and flooding in the Midwest.

Sources: NOAA, NASA
Hurricane Ike 2008: Lessons Learned

- **Better building codes especially for potential storm surge areas**
  - In many cases poor building quality contributed to loss of life and property
  - Buildings constructed according to the IBHS code survived the extreme storm surge and wind forces even on the hardest-struck Bolivar Peninsula

- **Post event loss estimations of Ike from catastrophe models alone proved difficult**
  - Post event estimations from catastrophe models had a wide range partly due to Ike’s special features mentioned before and factors, such as the large number of claims (more than 1,000,000), difficult to assess impacts on the oil industry and potential loss seepage from Gustav
  - In addition to catastrophe models expert judgment is necessary to get a complete picture of an event of Ike’s magnitude

Source: NOAA, SPC
Winter storm losses in 2008 were the lowest in 5 years, and $350 million below average.
California has averaged $480 million in Wildfire losses per year since 1990. 2008 Total: $630 million
The Midwest Floods of June 2008

- 24 fatalities - 150 people injured
- 40,000 properties flooded
- 5,000,000 acres of agricultural land flooded
- Estimated economic and insured losses of $10 billion and $500 million respectively
- Affected States: Iowa, Illinois, Indiana, Minnesota, Missouri, Wisconsin, and Michigan
- Cities of Cedar Rapids, Iowa City and Des Moines experienced record water levels and floods beyond the 500 year floodplain

The Floods of 2008 caused the second highest economic loss in the U.S. since 1980.
Global Catastrophe Update

Ernst Rauch
Head of Corporate Climate Center

Munich Re Group
January 15, 2009
Driven by high losses from weather related natural catastrophes and the earthquake of Sichuan/China, 2008 was the third most expensive year on record (economic and insured losses)

Throughout the world, more than 220,000 people died or are still missing

Insured losses in 2008 rose to US$ 45bn, about 50% higher than in the previous year

2008 continues the long-term loss trend Munich Re has been observing
Natural Catastrophes 2008

World map

- 750 natural hazard losses events
- Significant loss events

Great natural catastrophes
- Hurricane Ike (Sept. 6-14, 2008) Caribbean, USA
- Cyclone Nargis (May 2-5, 2008) Myanmar
- Earthquake (May 12, 2008) China
- Winter damage (Jan 10–Feb 13, 2008) China

- Geophysical (earthquake, tsunami, volcanic)
- Meteorological (storm)
- Hydrological (flood, mass movement)
- Climatological (extreme temperature, drought, wildfire)

Over the years 1980 - 2008, the number of geophysical events are more or less constant, while the number of atmospheric events have increased over this time period.
2008 was the 3rd most expensive year worldwide for natural catastrophes, both for insured and overall losses.
Natural Catastrophes 1980 - 2008
Worldwide distribution

18,000 loss events

- Geophysical events (Earthquake, tsunami, volcanic eruption): 13%
- Meteorological events (Storm): 14%
- Hydrological events (Flood, mass movement): 35%
- Climatological events (Extreme temperature, drought, forest fires): 38%

1,600,000 fatalities

- Geophysical events: 24%
- Meteorological events: 14%
- Hydrological events: 23%
- Climatological events: 39%

Overall losses* US$ 2,600bn

- Geophysical events: 12%
- Meteorological events: 22%
- Hydrological events: 24%
- Climatological events: 42%

Insured losses* US$ 630bn

- Geophysical events: 8%
- Meteorological events: 5%
- Hydrological events: 7%
- Climatological events: 80%

* in 2008 values

From 1980 - 2008, over 90% of the insured losses are from weather related catastrophes.

*In 2008 values*
2008 was – on the basis of figures adjusted for inflation – the third most expensive natural catastrophe year on record for the insurance industry. This continues the long-term trend we have been observing.

Climate change has already started and is very probably contributing to increasingly frequent weather extremes and ensuing natural catastrophes. These, in turn, generate greater and greater losses because the concentration of values in exposed areas, like regions on the coast, is also increasing further throughout the world.

2008 has again shown how important it is for us to analyze risks like climate change, in all its facets, and to manage the business accordingly.
For Munich Re, as a leading reinsurer, the natural catastrophe trends of recent years have resulted in three action strategies:

− We accept risks in our core business only at risk-adequate prices so that if the exposure situation changes, we adjust the pricing structure.

− With our expertise, we develop new business opportunities in the context of climate protection and adaptation measures.

− In the international debate, we – as a company – press for effective and binding rules on CO₂ emissions, so that climate change is curbed and future generations do not have to live with weather scenarios that are difficult to control.

CATASTROPHIC LOSS

2008 Losses Exceed 2007 and 2006 Combined
U.S. Insured Catastrophe Losses*

2008 CAT exceeded 2006/07 combined. 2005 was by far the worst year ever for insured catastrophe losses in the US

*Excludes $4B-$6b offshore energy losses from Hurricanes Katrina & Rita.

**Based on PCS data through Sept. 30. PCS $2.1B loss of for Gustav. $10.655B for Ike of 12/05/08.

Note: 2001 figure includes $20.3B for 9/11 losses reported through 12/31/01. Includes only business and personal property claims, business interruption and auto claims. Non-prop/Bl losses = $12.2B.

Top 12 Most Costly Disasters in US History, (Insured Losses, $2007)

9 of the 12 most expensive disasters in US history have occurred since 2004

In 2008, Ike became the 6th most expensive insurance event and 4th most expensive hurricane in US history

*PCS estimate as of 12/15/08.
Sources: ISO/PCS; AIR Worldwide, RMS, Eqecat; Insurance Information Institute inflation adjustments.

8 of the 10 most expensive hurricanes in US history have occurred since 2004.

In 2008, Ike 4th most expensive hurricane in US history

*PCS estimate as of 12/15/08 (in 2008 dollars).
Sources: ISO/PCS; Insurance Information Institute inflation adjustments.
Inflation-Adjusted U.S. Insured Catastrophe Losses By Cause of Loss, 1988-2007¹

- Fire, $8.1, 2.6%
- Wind/Hail/Flood, $9.9, 3.2%
- Earthquakes, $19.5, 6.3%
- Winter Storms, $24.4, 7.9%
- Terrorism, $22.9, 7.4%
- Civil Disorders, $1.1, 0.4%
- Water Damage, $0.4, 0.1%
- Utility Disruption, $0.2, 0.1%
- Tornadoes, $82.4, 26.5%
- All Tropical Cyclones, $141.6, 45.6%

Insured disaster losses totaled $310.7 billion from 1988-2007 (in 2007 dollars). Hurricane and tropical storms accounted for approximately $6.6 billion of these—45.6% of the total.

¹ Catastrophes are all events causing direct insured losses to property of $25 million or more in 2007 dollars. Catastrophe threshold changed from $5 million to $25 million beginning in 1997. Adjusted for inflation by the III.
² Excludes snow.
³ Includes hurricanes and tropical storms.
⁴ Includes other geologic events such as volcanic eruptions and other earth movement.
⁵ Does not include flood damage covered by the federally administered National Flood Insurance Program.
⁶ Includes wildland fires.

Meeting the Challenge, Keeping the Promise

Insurers Keep their Promise to Pay Catastrophe Losses Amid the Financial Crisis and Recession
How Insurance Industry Stability, Resilience Benefits Consumers

BOTTOM LINE:

• Insurance Markets—Unlike Banking—Are Operating Normally. This includes global reinsurance markets.

• The Basic Function of Insurance—the Orderly Transfer of Risk from Client to Insurer—Continues Uninterrupted

• This Means that Insurers Continue to:
  - Pay claims (whereas 25 banks have gone under)
  - Renew existing policies (banks are reducing and eliminating lines of credit)
  - Write new policies (banks are turning away people who want or need to borrow)
  - Develop new products (banks are scaling back the products they offer)

Source: Insurance Information Institute
Reasons Why P/C Insurers Have Fewer Problems Than Banks

- **Superior Risk Management Model**
  - Insurers overall approach to risk focuses on underwriting discipline: implies pricing accuracy and management of potential loss exposure
  - Banks eventually sought to maximize volume, disregarded risk
- **Low Leverage**
  - Insurers do not rely on borrowed money to underwrite insurance or pay claims
- **Conservative Investment Philosophy**
  - High quality portfolio that is relatively less volatile and more liquid
- **Strong Relationship Between Underwriting and Risk Bearing**
  - Insurers always maintain a stake in the business they underwrite, keeping “skin in the game” at all times
  - Banks and investment banks package up and securitize, severing the link between risk underwriting and risk bearing, with (predictably) disastrous consequences
- **Tight Regulation**
  - Insurers are more stringently regulated than banks, investment banks & hedge funds
- **Greater Transparency**
  - Insurer companies are an open book to regulators and the public

Source: Insurance Information Institute
CAPITAL & CAPACITY

The Insurance Industry is Financially Strong

Capacity peaked at $521.8 as of 9/30/07

$ Billions

- Q2: -$16.6B (-3.2%)
- Q3: -$43.3B (-8.3%)

Source: ISO
U.S. Policyholder Surplus: 1975-2008*

Actual capacity as of 9/30/08 was $478.5, down 7.6% from 12/31/07 at $517.9B, but 68% above its 2002 trough. Recent peak was $521.8 as of 9/30/07. Estimate as of 12/31/08 is $438B is 16% below 2007 peak.

The premium-to-surplus ratio stood at $0.94:$1 at year end 2008, up from near record low of $0.85:$1 at year-end 2007.

“Surplus” is a measure of underwriting capacity. It is analogous to “Owners Equity” or “Net Worth” in non-insurance organizations.

FINANCIAL STRENGTH & RATINGS

Industry Has Weathered the Storms Well
The number of impairments varies significantly over the p/c insurance cycle, with peaks occurring well into hard markets.

Source: A.M. Best; Insurance Information Institute

Impairment rates are highly correlated underwriting performance and could reach a record low in 2007.

Combined Ratio after Div
P/C Impairment Frequency

2007 impairment rate was a record low 0.12%, one-seventh the 0.8% average since 1969; Previous record was 0.24% in 1972.

Source: A.M. Best; Insurance Information Institute
Financial Institutions Globally Facing Huge Losses from the Credit Crunch*

The IMF estimates total “credit-turmoil-related” losses will eventually amount to $1.4 trillion.

*Banks

$600

$780

*Insurers

$106

$205

$205B or 20.8% of estimated total (bank+insurer) losses will be sustained by insurers worldwide.

Global losses since the beginning of 2007.

Northeast states have significant exposure. In 2004, Florida had more insured coastal exposure—at nearly $2 trillion than any other state. Future “Mega-Losses” are UNAVOIDABLE.
In 2007, Florida still ranked as the #1 most exposed state to hurricane loss, with $2.459 trillion exposure, an increase of $522B or 27% from $1.937 trillion in 2004.

The insured value of all coastal property was $8.9 trillion in 2007, up 24% from $7.2 trillion in 2004.
Summary

• Property/Casualty (Re)Insurance Industry Remains Well Capitalized Despite Financial Crisis, Recession & Higher Catastrophe Losses

• Industry is Highly Resilient
  • Designed to withstand major catastrophes and market crashes simultaneously

• The Industry Operates Under a Continuous “Doomsday” Philosophy
  • Assume that the worst can and will happen at any time

• This Means: Insurance Markets—Unlike Banking—Are Operating Normally

• The Promise to Pay Is Intact
